

Full Stack Engineer Technical Challenge

Objectives

- Build a simple frontend to display, and allow the modification of a user profile
- Build a simple backend that supports OAuth login with Google, and updating a user profile

General

- Use of **TypeScript** is mandatory
- Node version 20 or higher
- The README file should provide the list of command(s) necessary to start the project.
- If the projects require any environment variables, you must provide a `.env` file with sane defaults.

Frontend

- Uses either **NextJS/React**, **Angular**, or **VueJS** (NextJS is used internally)
- Provides a “Signin” page to authenticate
- Provides a “Profile” page to display and edit the users profile
- Session must be persistent between visits

Backend

- Uses **NestJS** as the backend framework
- Uses **SQLite or Postgres** as the database engine
- Uses an ORM framework for database interactions (TypeORM is used internally)
- Handle the **OAUTH** protocol for authentication
 - Handle login via `POST /auth/login/google` (public)
- Manage the users profile via
 - Get: `GET /user/profile` (private)
 - Update: `PUT /user/profile` (private)
- Uses JWT to authenticate private endpoints

Bonus

- Setup eslint and/or prettier for code formatting
- Use microservices with @nestjs/microservices with a broker transport (Redis, RabbitMQ, ...)

Evaluation

- **Functionality**
Does the application meet the requirements outlined above?
- **Code Quality**
Is the code well-organized, readable, and maintainable?
- **Security**
Does the application implement security best practices for handling user authentication and storing sensitive user data?
- **Design**
Is not evaluated. The frontend does not have to look good, only be functional.
- **Bonus objectives**
Are not mandatory but will be evaluated if present.
